

TRUST NURSES NOT A.I.

As nurses, we know that the hands-on work of caring for other people cannot and should not ever be automated. The work of registered nurses, and of other health care workers, must be provided in person. No artificial intelligence system, including automated worker surveillance and management systems and clinical decision support systems, will ever replace the human expertise and clinical judgement essential to providing the safe, effective, and equitable nursing care that all patients deserve. Nurses embrace, and regularly master, worker-centric technologies that complement bedside skills and improve quality of care for our patients. But we're concerned about certain technologies that are being implemented into hospital and care settings that do neither. The application of A.I. in health care settings must follow these principles in order to ensure quality patient care, safety, and equity.

We, the undersigned nurses, demand:

1. The right to high-quality person-to-person care.
2. The right to safety.
3. The right to privacy.
4. The right to transparency.
5. The right to exercise professional judgment.
6. The right to autonomy.
7. The right to collective advocacy for workers and their patients.
8. Management must meet with the PPC and our union to ensure patient and nurse safety regarding new technologies.
