

## Exhibit 5

### Amendment Justification Codes for 2019 VCBC Findings

#### Legend:

- A. This amendment is necessary for **Administrative** clarification and does not modify the Building Standards pursuant to the California Health and Safety Code Sections 17958, 17958.5 and 17958.7. This amendment establishes administrative standards for the effective enforcement of building standards throughout the unincorporated areas of the County of Ventura.
  
- B. This amendment is justified on the basis of a **Local Geologic Condition**. The County of Ventura is subject to a variety of geologic hazards including earthquake effects, hillside erosion and landslides, coastal wave and beach erosion, and subsidence. The County of Ventura has many active faults defined by the State of California, California Geologic Survey as part of the Alquist Priolo Earthquake Fault Zoning Act. The faults may produce fault rupture along the trace of the fault, ground shaking dependent on location and fault rupture source, liquefaction in the coastal plain and valleys, seiche within lakes and reservoirs, tsunamis along the coast, and landslides in the hillside areas. Other geologic hazards include landslides such as the 1995 La Conchita event, debris flows such as the 2005 La Conchita event and smaller post fire debris flows. Properties along the coast are subject to potential tsunamis as well as storm waves causing beach erosion. Ventura County is also subject to potential hazards from sea level rise. Subsidence is also a potential hazard to due subsurface fluid withdrawal either of groundwater or oil and gas. Ventura County is within the Transverse Ranges Geomorphic Province of California and is subject to north-south tectonic compression which explains the east west trending valleys of the county as well as provides the engine to drive the geologic processes affecting the County. Thus, the modifications and changes cited herein are designed to better evaluate these hazards, as well as, to provide design to limit property damage from a geologic event and permit faster recovery. The above summarized geologic conditions require additional criteria than provided in the California Building Standards Code.
  
- C. This amendment is justified on the basis of a **Local Climatic Condition**. The seasonal climate conditions during mid to late summer and fall create severe fire hazards which can directly affect public health and welfare within the County. Hot, dry weather combined with “Santa Ana Wind” conditions have resulted in wildland fires that can spread quickly through the thousands of acres of brush covering the open space, hills and valleys that exist throughout the County. Additionally, seasonal short-term heavy rain patterns in hillside areas can adversely affect varying soil conditions requiring additional design consideration. These conditions, combined with the local geological characteristics of the hills and valleys within the County create hazardous conditions for which amending the California Building Standards Code is required.
  
- D. This amendment is justified on the basis of a **Local Topographic Condition** specific to the County of Ventura. The topography of the County of Ventura ranges from a very gently sloping coastal plain to very steep mountains and coastal bluffs. The geologic composition of the hillside and bluffs create unique topographic features that may require enhanced design. The steepness of the hills also creates unique conditions for first responders to emergencies such as fires, landslides, debris flows, and flooding events that the practice of shelter in place is required. The modifications to the California Building Standards Code under topography reflect the possibility that inhabitants will need to shelter in place during an event. The topography also provides higher rainfall total in the hillsides than the coastal plain, however several hours after storms the coastal plain may be subject to flooding. These modifications to the California Building Standards Code are reasonably necessary to provide for increased protection from the potential hazards that are exacerbated by the local topography.
